

## ...CHAPTER 4

### Smallpox – eradication?

Turning to the story of smallpox vaccination, we see an almost blind faith and disregard of available evidence in the much-touted anecdote 'smallpox has been eradicated by vaccination'.

- In England free **smallpox vaccines were introduced in 1840** and made compulsory in 1853.
- Between 1857 and 1859 there were 14,244 deaths from smallpox. Between 1863 and 1865 after a population rise of 7%, the **death rate rose by 40.8%** to 20,059.
- In 1867 evaders of vaccination were prosecuted. Those left unvaccinated were very few. Between 1870 and 1872 after a population rise of 9%, the **death rate rose by 123%** to 44,840.
- Then we see the phenomena of reclassification, at the time all authorities agree that chickenpox is non-fatal. Yet in the 30 years up to 1934, 3,112 people are stated to have died of chickenpox and only 579 of smallpox in England and Wales.

**Smallpox was the first illness to be targeted with a mass vaccination campaign in 1840, which in fact lead to a dramatic increase in death rates from smallpox when most other illnesses without vaccines were experiencing a steady decline.**

(See the mortality rates of Scarlet fever, diphtheria, tuberculosis, whooping cough, tetanus and measles above).

When eventually mortality did decline, lagging behind all the other illnesses looked at, we are told that this was due to the highly successful smallpox vaccine; a conclusion that could only have been drawn by someone ignoring all the medical evidence to date.

Because levels of illness have been declining for many years prior to vaccination, evidently there are many factors responsible for this, other than the use of vaccines. So we are left with the issue of deciding what effect did vaccines have over and above what clearly would have happened anyway?

# ...CHAPTER FIVE

## Herd Immunity & Smallpox

The only illness said to have been eradicated by vaccination is smallpox (although cases are still said to exist under a different classification) and interestingly the eradication is supposed to have occurred worldwide when in fact vaccine uptake rates were nothing like what they were supposed to be in order to achieve herd immunity.

*“The disappearance of smallpox from many regions despite the continued presence of large numbers of unvaccinated susceptibles was evident from the historical record (as had been noted by Farr more than a century ago).”*

Paul E.M. Fine Epidemiologic Reviews 1993  
Johns Hopkins University, Vol. 15, No. 2

More importantly it was the only mass vaccinated illness before the 1900's and the only illness to increase in death rate after the use of the vaccine, whilst all other illnesses were in decline without the use of vaccines. The symptoms of smallpox are still evident according to the World Health Organisation, only now the clinically identical illnesses are classified by different names for example 'monkey pox'. The real biochemical proof of eradication is said to be due to the fact that the vaccine virus is not found in the natural world.

Given that the only smallpox viral components we have are those that have been used for vaccines and now kept in laboratories, and that they have been so dramatically changed over time in the ongoing production of vaccines, it is highly probable that no naturally occurring virus or similar DNA thought to be from the virus looks anything like the supposed smallpox components that we have in the vaccine. It is very likely that the virus hasn't been eradicated, it's just that vaccine manufacturers have produced a vaccine virus that cannot be found in the natural world.

From the vaccine promoters point of reference obviously the more people vaccinated the better, however there is no verifiable percentage uptake that leads to the elimination of the disease, this is a complete mathematical hypothesis unproven with regard to any vaccine, and in any disease situation. If vaccines work, then the 'vaccinated' are protected, and they need not worry about those that choose to not vaccinate. The fact that vaccines cannot be given to sick people, the very people that need intervention to increase their immune function shows the potential problems with vaccines, problems that are not evident from any other natural immune enhancing intervention. Alternative and natural therapeutics, unlike vaccines, are actually designed for the sick.
